It was obtd. by PCR amplification of cucumber seedling cDNA using primers based on isolated peptide fragments of the protein. The gene can be expressed in bacterial or other systems for use in recombinant expansin prodn. Expression of the gene in transgenic plants may allow alteration of plant growth characteristics, while expression in plant tissue cultures may allow improved prodn. Of useful chemicals.

       This invention describes a novel vector (A) comprising (i) nucleic acid (I) encoding an expansin (II) and (ii) coupled sequences that allow expression of (I) in microorganisms. The recombinant expansins described in the invention are used in preparation, treatment and finishing of cellulose-based textiles (e.g. cotton) or in recycling of paper or for preparation of pulp from plant tissue, as a substitute for corrosive chemicals currently used in papermaking. Recombinant methods make possible large scale production of extensins possible. This sequence encodes the Cucumis sativus (cucumber) extensin, csexpla, described in
                                                                                                                                                             Vector encoding an expansin, useful in treatment of cellulosic materials for paper recycling, providing large-scale production
                                                                                                                                        Claim 2;
                                                                                                                                                                                                      P-PSDB; AAG80769

The recombinant expansins described in the invention are used in preparation, treatment and finishing of cellulose-based textiles (e.g. cotton) or in recycling of paper or for preparation of pulp from plant tissue, as a substitute for corrosive chemicals currently used in papermaking. Recombinant methods make possible large scale production of extensins possible. This sequence encodes the Cucumis sativus (cucumber) S1 extensin homologue described in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                  The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising:

(a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and

(b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the
                                                                                                                                                                                                                                                                          Identifying a stress and producing plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       24-AUG-2000; 2000US-227866P.

The present invention relates to novel genes which encode cell wall hydrolases such as beta-galactosidase (beta-Gal), pectin methylesterase (PME), polygalacturonase (PG) and cell wall proteins such as expansin1 (Exp1) and expansin2 (Exp2) proteins from pear fruit. The nucleic acids are useful for regulating fruit ripening and for suppressing endogenous beta-Gal, PME, PG, Exp1 and Exp2 genes in any fruit or other plant organs, thus modifying the structure of the cell walls of the fruit or plant and providing for ripe yet firm fruit and vegetables. The genes may be used to screen a cDNA library or a genomic library from any species, to inhibit or enhance gene expression or to produce transgenic plants. The present sequence is a cDNA encoding pear expansin 2 protein.
                                                                                                                                                                                                  rArgAsnTrpGlyGlnAsnTrpGlnSerAsnAsnTyrLeuAsnGlyGlnGlyLeuSerPh
